Listings of equations, figures, tables and sections of the article 'Musical elements in the discrete-time representation of sound' and of the scripts in the MASS toolbox

Renato Fabbri (USP), Vilson Vieira da Silva Junior (The Grid), Antônio Carlos Silvano Pessotti (Unimep), Débora Cristina Corrêa, Osvaldo N. Oliveira Jr. (USP)

August 5, 2017

The article is the main document of the MASS toolbox. Being it of considerable length and complexity, this document contains listings of its elements to facilitate its navigation, apprehension and general usage.

Contents

SI-2 Equations

Table 0.1: Equation numbers and their descriptions. All these equations are implemented in file src/sections/2.py.

Number Description 1 relation between number of samples and duration 2 power of the wave 3 decibels by difference by means of the power of each wave 4 double amplitude implies ≈ 6dB 5 double power implies ≈ 3dB 6 double volume (10dB) implies a factor of ≈ 3.16 for amplitude 7 direct relation between variations in amplitude and decibels 8 equivalences in a periodic sound with respect to wavelength, frequency and sample rate 9 9 sample amplitudes in a sinusoid 10 sample amplitudes in a sawtooth wave 11 sample amplitudes in a square wave 12 sample amplitude in a square wave 13 samples in a sound derived from a sampled wave period 14 reconstruction of samples from the Fourier components 15 reconstruction of real samples (e.g. for audio) from Fourier component 16 number of pairs of Fourier coefficients which are related to the same frequency 17 indexes of equivalent frequencies and coefficients for real signals 20 equivalence in phases between samples of real signals <t< th=""><th colspan="3">Description</th></t<>	Description		
power of the wave decibels by difference by means of the power of each wave double amplitude implies ≈ 6dB double power implies ≈ 3dB double volume (10dB) implies a factor of ≈ 3.16 for amplitude direct relation between variations in amplitude and decibels equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a triangular wave sample amplitude in a square wave sample amplitude in a square wave sample sin a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform	-		
double amplitude implies ≈ 6dB double power implies ≈ 3dB double volume (10dB) implies a factor of ≈ 3.16 for amplitude direct relation between variations in amplitude and decibels equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a triangular wave sample amplitude in a square wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform	_		
 double power implies ≈ 3dB double volume (10dB) implies a factor of ≈ 3.16 for amplitude direct relation between variations in amplitude and decibels equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a triangular wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform 			
double volume (10dB) implies a factor of ≈ 3.16 for amplitude direct relation between variations in amplitude and decibels equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a sawtooth wave sample amplitudes in a triangular wave sample amplitude in a square wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equal modules between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
direct relation between variations in amplitude and decibels equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a sawtooth wave sample amplitudes in a triangular wave sample amplitude in a square wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the samfrequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
equivalences in a periodic sound with respect to wavelength, frequency and sample rate sample amplitudes in a sinusoid sample amplitudes in a sawtooth wave sample amplitudes in a triangular wave sample amplitude in a square wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the samfrequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
and sample rate sample amplitudes in a sinusoid sample amplitudes in a sawtooth wave sample amplitudes in a triangular wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
sample amplitudes in a sawtooth wave sample amplitudes in a triangular wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform	V		
sample amplitudes in a triangular wave sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
sample amplitude in a square wave samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
samples in a sound derived from a sampled wave period reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
reconstruction of samples from the Fourier components reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
reconstruction of real samples (e.g. for audio) from Fourier component number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
number of pairs of Fourier coefficients which are related to the same frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
frequency indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
indexes of equivalent frequencies and coefficients for real signals equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform	Э		
equal modules between samples of real signals equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
equivalence in phases between samples of real signals complete reconstruction of the signal using Fourier components and pre vious equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
complete reconstruction of the signal using Fourier components and previous equations sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
vious equations 21 sample sequence related to a basic note 22 sample sequence of a period of an arbitrary waveform	_		
sample sequence related to a basic note sample sequence of a period of an arbitrary waveform			
sample sequence of a period of an arbitrary waveform			
distance of a (sound) source to each ear given the distance between the	Э		
ears and an (x,y) position of the source			
Interaural Time Difference (ITD), the time difference of a sound reaching each ear	5		
Interaural Intensity Difference (IID), the intensity difference (in deci	-		
bels) of a sound reaching each ear			
27 ITD and IID in terms of sample delays and their amplitudes			
28 azimuthal angle of a (x, y) source			
samples that result from mixing sounds			
30 samples that result from concatenating sounds			

Table 0.2: Equation numbers and their descriptions. All these equations are implemented in file src/sections/3.py.

sample sequence generated by means of a lookup table (LUT) frequency at each sample in a linear transition of frequency indices of a LUT in a linear transition of frequency sample sequence obtained through a LUT in a linear transition of quency frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear parameters)	(lin-
frequency at each sample in a linear transition of frequency indices of a LUT in a linear transition of frequency sample sequence obtained through a LUT in a linear transition of quency frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear parts)	(lin-
indices of a LUT in a linear transition of frequency sample sequence obtained through a LUT in a linear transition of quency frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear parts)	(lin-
sample sequence obtained through a LUT in a linear transition of quency frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear p	(lin-
quency frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear p	(lin-
frequency at each sample in an exponential transition of frequency ear pitch) indices of a LUT in an exponential transition of frequency (linear p	`
indices of a LUT in an exponential transition of frequency (linear p	. : 4 - 1 \
	oiten)
sample sequence obtained through a LUT in an exponential trans of frequency	sition
amplitude factors at each sample in an exponential transition of a tude (\approx linear volume)	mpli-
sample sequence with an exponential transition of amplitude (\approx l volume)	linear
40 amplitude factors at each sample in a linear transition of amplitude	de
sample sequence in an exponential transition of amplitude (\approx l volume) with difference given in decibels	
sample sequence obtained through the convolution of two other quences (e.g. for applying FIR filters)	er se-
difference equation (e.g. for applying IIR filters)	
44 IIR coefficients for a simple, useful and well-behaved low-pass filter	er
45 IIR coefficients for a simple, useful and well-behaved high-pass filt	
auxiliary variables for the following band-pass and band-reject filt	
47 IIR coefficients for a simple, useful and well-behaved band-pass file	
48 IIR coefficients for a simple, useful and well-behaved band-reject f	
Fourier coefficients of a white noise	
Fourier coefficients of a pink noise	
51 Fourier coefficients of a brown noise	
52 Fourier coefficients of a blue noise	
53 Fourier coefficients of a violet noise	
Fourier coefficients of a black noise	
55 indices for a vibrato given its frequency and using a LUT	
56 samples for applying a vibrato	
frequency at each sample of a sound with vibrato	
58 indices for LUT in a sound with vibrato	
sample sequence of a sound with vibrato	
amplitude at each sample for a tremolo	
sample sequence of a sound with tremolo	
components in FM synthesis when both modulator and carrier are	sines
63 the Bessel function	
components in AM synthesis when both modulator and carrier are	sines
65 indices for LUT in modulator of an FM synthesis	
sample sequence of a modulator in an FM synthesis	
frequency at each sample of a sound derived from FM synthesis	
68 indices for the final signal in FM synthesis using LUT	
sample sequence of a sound generated through FM and using LUT	Γ
amplitude at each sample in a sound generated though AM	
sample sequence of a sound generated through AM and using LUT	Γ

Table 0.3: Equation numbers and their descriptions. All these equations are implemented in file src/sections/3.py.

Number	Description	
72	an example of bonds between musical characteristics	
73	relation between frequencies and speed in the Doppler effect	
74	relation between position, speed and amplitude in the Doppler effect	
75	relation between position, speed and amplitude in the Doppler effect	
76	samples of a FIR filter for the first period of a reverberation	
77	samples of a FIR filter for the second period of a reverberation	
78	samples of the FIR filter for a reverberation (considering both first and	
	second periods)	
79	amplitude factors for each sample in an ADSR envelope	
80	sample sequence of a sound with an ADSR envelope	

Table 0.4: Equation numbers and their descriptions. All these equations are implemented in file src/sections/4.py.

Number	Description
81	perfectly symmetric scales in each octave with the twelve semitones
82	diatonic scales
83	the succession of tones and semitones of a diatonic scale
84	sequences of semitones for the three types minor scales
85	harmonic series in terms of semitones
86	triads (chords constituted by thirds)
87	a convention to specify a unit of rhythmic division or agglomeration
88	definition of algebraic groups

SI-3 Figures

Table 0.5: Figure numbers and their descriptions. All these equations are implemented in files src/aux/*.

Number	Description	
1	PCM PCM audio (discrete and digital) samples	
2	synthetic and sampled waveforms	
3	spectrum of basic waveforms	
4	spectrum of a real note and of one derived from one sampled period	
5	sinusoid represented by two samples	
6	sinusoid represented by three samples	
7	sinusoids in 4 samples	
8	basic waveforms within 4 samples	
9	sinusoids in 6 samples	
10	basic waveforms withing 6 samples	
11	ITD and IID (spatial localization cues)	
12	mixing PCM audio	
13	concatenation/juxtaposition of PCM audio	
14	Lookup table	
15	transitions of intensity	
16	convolution	
17	convolution yielding time shifting, multiple time delays, sound amalgam	
18	frequency response of useful IIR filters	
19	spectrum and waveform of noises	
20	spectrogram of a vibrato	
21	waveform of a tremolo	
22	ADSR envelope	
23	counterpoint movements	
24	musical metric in terms of divisions of temporal units	
25	distinctions of musical climax by localization	

SI-4 Tables

Table 0.6: Table numbers and their descriptions.

Num	nber	Description
1		musical intervals, their notations and qualities
2	2	tonal harmonic functions in the major scale
3	3	duration scales yielding perception of pitch and rhythm
4	1	music by permutation of units (change ringing)

SI-5 Scripts

SI-5.1 For all equations and relations in each section.

Table 0.7: Script files and their descriptions.

Filename	Description
src/sections/2.py	implementation of all the equations for the basic note in PCM audio in
1 3	Section 2
<pre>src/sections/3.py</pre>	implementation of all the equations for variations within a note described
10	in Section 3
<pre>src/sections/4.py</pre>	implementation of all the techniques for assembling notes into music
10	described in Section 4

SI-5.2 To render musical pieces

Table 0.8: Piece names, script files and the concepts they exemplify from Section 2. All files are in the directory src/pieces2/.

Name	Filename	Description
Reduced-fi	reduced-fi.py	concatenation of simple notes
Sonic pictures	quadrosSonoros.py	mixing of simple notes

Table 0.9: Piece names, script files and the concepts they exemplify from Section 3. All files are in the directory src/pieces3/.

Name	Filename	Description
ADa and SaRah	ADAandSaRah.py	ADSR envelope
Tremolos, Vibratos and Fre-	bonds.py	bonds between tremolos, vibratos
quency		and frequency
Bella Rugosi	bellaRugosi.py	rugosity achieved through frequencies
		between 15 adn 30 Hz
Children Choir	childChoir.py	achieving choir sonorities by small
		variations of the same basic note
Noisy Band	noisyBanda.py	using various noises
ParaMeter Transitions	paraMeter.py	gradual changes of parameters within
		one note
Little Train of Impulsive Hill-	littleTrain.py	the use of convolution with impulses
bilies ¹		to achieve rhythm
Shakes and Wiggles	shakesWiggles.py	tremolos and vibratos

Table 0.10: Piece names, script files and the concepts they exemplify from Section 4. All files are in the directory src/pieces4/.

	· •	
Name	Filename	Description
Acorde Cedo	acordeCedo.py	chord successions and modulation
Conta Ponto	contaPonto.py	melodic lines conducted within the
		rules of counterpoint
Crystals	crystals.py	symmetric musical scales
Dirracional	dirracional.py	directional arcs
Intervals	intervals.py	musical intervals
MicroTone	microTone.py	microtonality (the use of intervals
		smaller than the semitone)
Poly-Hit-My	polyHitMy.py	polyrhythm (multiple metrics at
		once)
Dirracional Intervals MicroTone	dirracional.py intervals.py microTone.py	directional arcs musical intervals microtonality (the use of intervals smaller than the semitone) polyrhythm (multiple metric

SI-5.3 To render the figures used in the article

The files src/figures/* render each of the figures (listed above in Section SI-3.

SI-6 Other documents

The files in latex/* render the article PDF and this Supporting Information file.

The script src/aux/iso226.py can generate the Equal Loudness Contour as described in its latest revision [iso226].

The article is largely based on the MSc dissertation [dissertacao].
